# Regular Expression Basics: Takeaways 🖻

by Dataquest Labs, Inc. - All rights reserved © 2020

### **Syntax**

#### **REGULAR EXPRESSION MODULE**

• Importing the regular expression module:

```
import re
```

• Searching a string for a regex pattern:

```
re.search(r"blue", "Rhythm and blues")
```

#### **PANDAS REGEX METHODS**

• Return a boolean mask if a regex pattern is found in a series:

```
s.str.contains(pattern)
```

• Extract a regex capture group from a series:

```
s.str.extract(pattern_with_capture_group)
```

#### **ESCAPING CHARACTERS**

• Treating special characters as ordinary text using backslashes:

\[pdf\]

## **Concepts**

- Regular expressions, often referred to as regex, are a set of syntax components used for matching sequences of characters in strings.
- A pattern is described as a regular expression that we've written. We say regular expression has matched if it finds the pattern exists in the string.
- Character classes allow us to match certain classes of characters.
- A set contains two or more characters that can match in a single character's position.
- Quantifiers specify how many of the previous characters the pattern requires.
- Capture groups allow us to specify one or more groups within our match that we can access separately.
- Negative character classes are character classes that match every character except a character class.
- An anchor matches something that isn't a character, as opposed to character classes which match specific characters.
- A word boundary matches the space between a word character and a non-word character, or a word character and the start/end of a string
- Common character classes:

```
Character
               Pattern
                         Explanation
Class
                         Either f, u, or d
Set
               [fud]
                         Any of the characters a , b , c , d , or e
Range
               [a-e]
               [0-3]
                         Any of the characters 0, 1, 2, or 3
Range
                         Any uppercase letter
Range
               [A-Z]
Set + Range
               [A-Za-z] Any uppercase or lowercase character
Digit
               \d
                         Any digit character (equivalent to [0-9])
                         Any digit, uppercase, or lowercase character (equivalent to [A-Za-
Word
               \w
                         Any space, tab or linebreak character
Whitespace
               \s
                         Any character except newline
Dot
```

• Common quantifiers:

Numeric

#### Quantifier **Pattern Explanation** Zero or more a\* The character a zero or more times The character a one or more times One or more a+ Optional a? The character a zero or one times Numeric a{3} The character a three times Numeric a{3,5} The character a three, four, or five times Numeric a{,3} The character a one, two, or three times

• Common negative character classes:

<b>Character Class</b>	Pattern	Explanation
Negative Set	[^fud]	Any character except <b>f</b> , <b>u</b> , or <b>d</b>
Negative Set	[^1-3Z\s]	Any characters except 1 , 2 , 3 , z , or whitespace characters
Negative Digit	<b>\D</b>	Any character except digit characters
Negative Word	\W	Any character except word characters
Negative Whitespace	<b>\S</b>	Any character except whitespace characters

a{8,} The character a eight or more times

• Common anchors:

Anchor	Pattern Explanation					
Beginning	^abc	Matches	abo	only at the start of a string		
End	abc\$	Matches	abo	only at the end of a string		
Word boundary	s\b	Matches	S	only when it's followed by a word boundary		
Word boundary	s\B	Matches	S	only when it's not followed by a word boundary
