## Introduction to Git: Takeaways 🖻

by Dataquest Labs, Inc. - All rights reserved © 2020

## **Syntax**

· Getting started with Git

qit

· Initializing a repo

git init

• Check the state of each file

git status

Add files to staging area

git add

- · Configure identity in Git
  - · Configure email

```
git config --global user.email "your.email@domain.com"
```

· Configure name

```
git config --global user.name "Your name"
```

· Making a commit

```
git commit -m "Commit message here"
```

- · Viewing the diff
  - · View the diff before staged

```
git diff
```

• View the diff after staged

```
git diff --staged
```

· View repo's commit history

```
git log
```

## **Concepts**

- Distributed version control systems will "merge" changes together intelligently, and exist to enable multiple developers to work on a project at the same time.
- $\bullet \ \ \text{A repository (or "repo") tracks multiple versions of the files in the folder, enabling collaboration.}$
- While there are multiple distributed version control systems, Git is the most popular.
- Files and folders with a period prefix are typically private.
- Commits are checkpoints that you store after adding files and/or making changes.
- A diff are the changes between commits.

- Files can have one of three states in Git:
  - **committed**: The current version of the file has been added to a commit, and Git has stored it.
  - **staged**: The file has been marked for inclusion in the next commit, but hasn't been committed yet (and Git hasn't stored it yet). You might stage one file before working on a second file, for example, then commit both files at the same time when you're done.
  - modified : The file has been modified since the last commit, but isn't staged yet.
